

Chapter 5: Web Designing Using Multimedia

This chapter explores the structured process of creating web applications and the fundamental language of the World Wide Web, HTML.

5.1 Web Applications

Websites are categorized based on their purpose and service:

- **Information Communication:** Portals for education or health (e.g., nie.lk).
- **e-Commerce:** Sites for buying and selling (e.g., amazon.com).
- **Entertainment:** Platforms for media downloads and streaming (e.g., netflix.com, youtube.com).
- **Advertising:** Providing info on goods/services (e.g., adcash.com).
- **News:** Publishing current events using multimedia (e.g., bbc.co.uk).

5.2 HTML: Hyper Text Markup Language

HTML is a **Markup Language**, not a programming language. It tells the web browser how to display content on the screen.

Standard HTML Page Structure

```
<html>
  <head>
    <title>Page Title</title>
  </head>
  <body>
    Visible content goes here.
  </body>
</html>
```

5.3 Essential HTML Tags

Tag	Description
<h1> to <h6>	Headings (h1 is largest, h6 is smallest).
<p>	Defines a paragraph.
 	Inserts a single line break.
<hr>	Inserts a horizontal line (thematic break).
 / <i> / <u>	Bold, Italic, and Underline text.
<center>	Centers the enclosed content.

5.4 Structuring and Planning

Successful web design involves several planning steps:

1. **Identifying Content:** Determining text, images, and videos.
2. **User Needs:** Analyzing the target audience.
3. **Sitemap:** Visualizing the link structure between pages.
4. **Maintenance:** Planning how to update the website over time.
